HILLCO

SPRINGTOOTH HARROW

The Hillco STH1010, available in 60' and 72' widths, is an excellent tool for seed bed preparation, leaving a smooth finish and allowing the operator to cover more acres in less time.

Shank Spacing

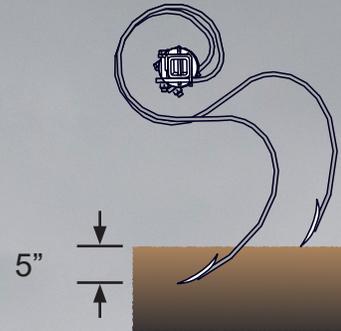

Shanks are on 6" spacing with 4 rows of shanks allowing for more residue clearance. The standard spikes are reversible and a high wear cast allow spike is optional.

The sleds have replaceable bottom skids made from abrasion resistance metal. The front ski is reversible for extended wear.

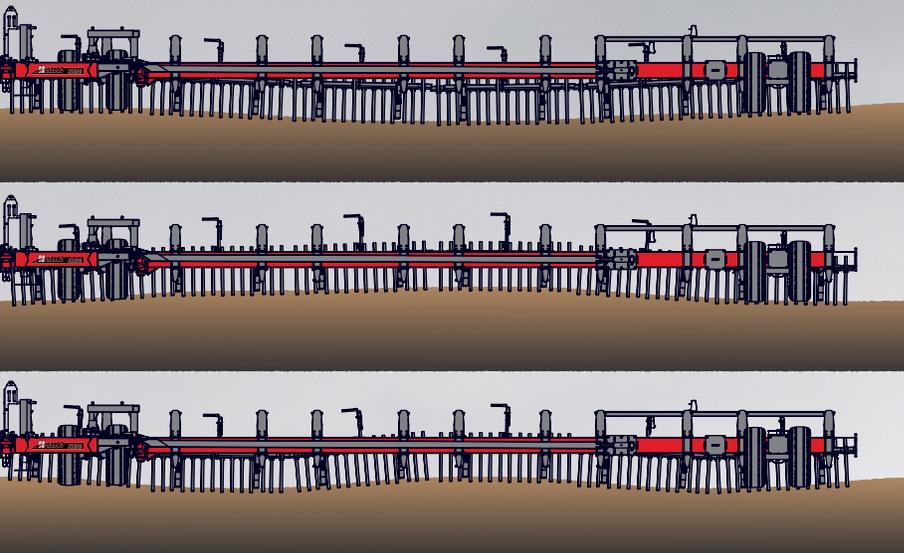

A 7 bar harrow pulls behind each sled leveling the ground surface making an excellent seed bed.

Depth Control

The depth of the spring tooth teeth can be adjusted from just scratching the surface to a maximum depth of 5". Each sled's depth is adjusted manually by adjusting the depth handle.

Ground Contouring

The springtooth sleds contour uneven ground providing consistent cultivating depth.

Each sled has two runners that slide across the ground allowing each sled to individually move with varying terrain.

Regular field cultivators do not have the ability to contour the ground with as much precision as the spring tooth.
